

**RAJIV GANDHI COLLEGE OF ENGINEERING AND
TECHNOLOGY**

COMPUTER SCIENCE AND ENGINEERING

ASSIGNMENT - 3

Prepared by: Mohamed . B . Sirajuddeen

Reg No : 22TD0053

Subject Name : Enterprise Solutions

Subject Code : CST61

Year/Sem/Sec : 43/86/B

Date of Submission: 3/4/2025

Unit : 3

Teacher's Sign :

Department Vision And Mission

Vision

Cultivate student as technocrats, researchers, and entrepreneurs in the field of computer science and engineering.

Mission

To impart quality education in Computer Science and Engineering by means of learning techniques and value-added courses.

To inculcate professional excellence and research culture by encourage projects in cutting-edge technologies, through industry interaction.

To build leadership skills, ethical values and teamwork among students.

To strengthen the collaboration of department and industry through internships, mentorships and professional body activities.

1) Concept of Oracle EDI

* EDI (Electronic data information] is the electronic exchange of business documents between the complete system of business partners, with a standard format own a communication network. It can also be called as paper less exchange.

EDI Standard Format

* The business documents that are been exchange between business partners need to be in a standard format, ANSI x12 or EDI FACT.

Components

Three major components in EDI process

- * Application device
- * Translation device
- * Communication device

Application Services

- It provides the link between application and EDI. It allows you to documents from an EDI system.

Transaction device

Translate the outgoing documents from an internal format file to an agreed external format.

Communication device

It sends and receives transmission files, to and from the trading partners with direct or by using partly device called a value added network (VAN)

Advantages

- One time data entry
- Reduced errors
- Online data storage
- Faster management reporting
- Automatic Data.

Function of EDI

- * Define trading partner relationship
- * Define code conversion
- * Use standard report submission.
- * Initiate import process.
- * Initiate extract process

Step 1: Define data file directories

To use IEDI gateway you must first create directories where data files for both inbound and outbound transactions are stored.

Step 2: Define transaction partner data.

First define a trading partner group and associations are trading partner group location enter to the group.

Step 3: Define code conversion.

Define code conversion categories to specify the subset of codes within the code conversion.

tables.

Step 4: Customize data file format.

Step 5: Initiate EDI transaction.

Once the data file director's trading partner information, code conversion, and optional customization, of data files save performance use oracle application standard request.

2) Oracle Application Framework:

+ OAF is a java based framework that follow model-view controller MVC architecture. It is used to develop customize, extend oracle E-business suite application.

Key features

- Built on Java EE; Uses java and XML for creating user interfaces.
- Integrated with Oracle EBS:
 - Supports seamless integration with oracle E-business application.
- Personalization: Allows modification at the user or role level without coding.
- Security and scalability: Uses oracle's security model to ensure data integrity and user access control.

OAF in enterprise solution:

OAF is widely used in large organization that rely on oracle EBS for business operation.

Including;

- Finance and accounting CAP, AR, GL modules
- Human resource management [HRMS, payroll]
- Supply chain procurement [i procurement, inventory]
- Customer relationship management (CRM)
- Manufacturing and project management.

Benefits of using OAF in enterprises.

- + Standardization, ensures uniform application development within oracle EBS.
- + Lower development costs: Reduces the need for third-party software.
- + User-friendly provides a consistent or access oracle application.
- Support for multi language and multi-currency essential for global enterprises.

3) PL/SQL fundamental with work flow analysis.

SQL: is a set-based, high level declarative computer language with which all programs and users access data in a Oracle database.

- Provides an interface to a relational unified tasks such as the following in one consistent language
- + Creating, replacing, altering and dropping object.
- + Inserting, updating and altering table rows

- * Controlling access to the database limits objects.
- * Guaranteeing database consistency and integrity.

SQL statements

- * All operations performed on the information in an Oracle database are run using SQL statements.
- * A SQL statement is a computer program or instruction that consists of identifiers, parameters, variables, data types.

The type of statements are

- * Data definition language
- * Data manipulation language

Data definition Language

- * Delete all the data in schema objects without removing the structure of these objects (TRUNCATE)
- * Grant and revoke privileges and roles (GRANT, REVOKE)
- * Turn option on and off (AUDIT, NOAUDIT)

Data Manipulation Language

- * DML statements are the most frequently used SQL statements and enable to:
 - * Retrieve or fetch data from one or more tables or views (SELECT)

PL/SQL

- * It was developed by Oracle Corporation in the early 90's to enhance the capabilities of SQL.

PL/SQL engine

- * Language code can be stored in the client system or in the database.

PL/SQL block consist of three sections.

The declaration section.

The execution section.

The exception handling section.

Declare

Variable declaration

Begin

Program execution

Exception

Exception handling

end

Advantage

- * Improved performance
- * Memory allocation
- * Improved productivity
- * Integrity -
