

**RAJIV GANDHI COLLEGE OF ENGINEERING AND
TECHNOLOGY**

COMPUTER SCIENCE AND ENGINEERING

ASSIGNMENT - 4

Prepared by: Mohamed . B . Sirajuddeen

Reg No : 22TD0053

Subject Name : Enterprise Solutions

Subject Code : CST61

Year/Sem/Sec : 43 / S6 / B

Date of Submission: 7/4/2025

Unit : 4

Teacher's Sign :

Department Vision And Mission

Vision

Cultivate student as technocrats researchers and entrepreneurs in the field of computer science and engineering.

Mission

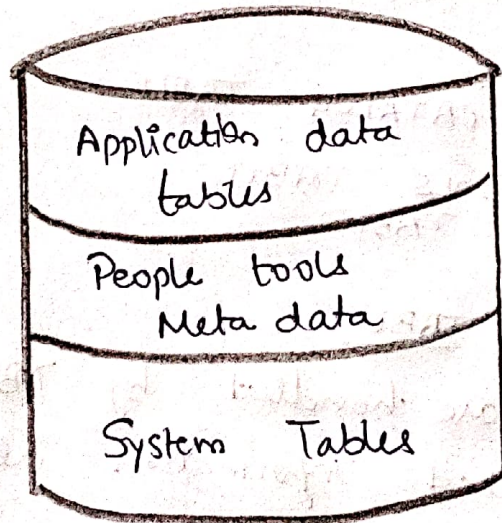

- The impart quality education in computer science and engineering by means of learning techniques and value-added courses.
- To inculcate professional excellence and research culture by encouraging projects in cutting edge technologies, through industry interactions.
- To build leadership, skills ethical values and team work among the students.
- To strengthen the collaboration of departments and industry internships, mentorship and professional body activities.

1. People's soft functionality with database structure.

People soft has a long history of offering customers a choice of market leading databases. people tools provide an abstraction layer, which insulates application developers from the intricacies of each of the specific databases platforms.

- Oracle
- IBM DB2
- Microsoft SQL server
- Informix
- Syntex

After you install your database engine there are three distinct layers within the database that work in concert to store and manage data for your people soft system.

System tables also called system catalog tables, are analogous to a table of contents for a book or to file allocation tables on a hard drive.

Keep track of all of the objects that reside in the database instance.

- Are created by and owned by the RDBMS.
- Are often described as system metadata.

People tools table provide the infrastructure for people soft applications by storing and managing people soft application metadata.

- Define the structure of all object definitions that make up an application.
- Use the the same table structure for all applications.

Application data tables store data entered through a people soft application. The specific tables and their structures vary by application.

- Contain transactional data entered by users.

People soft database architecture consists of

3 categories:

- SYSTEM CATALOG TABLE
- PEOPLE TOOLS TABLE
- APPLICATION TABLE

SYSTEM CATALOG TABLE:

These tables are handled by DBA's since it has the DB related information along with it is used to check the performance of the people soft DB.

Eg: System catalog tables are: SYSCOLUMNS, SYS-TABLES.

PEOPLE TOOLS TABLES:

- All delivered tables can be found in peopletools Tables.

Eg: People table tools are: PSRECDDEFN, PSDEI1ED.

Application TABLES:

The tables we develop are stored in application tables people soft has preferred the naming convention of application tables to be starting with B -

↳ eg: PS - EMPL - TBL

- PSR EDEFN

- PSD B FIELD

- PS - JOB

- PS - EMP - TBL

→ Application tables are further categorized into three parts as follows:

- Control table
- Transaction tables
- Run control table

2) Elucidate about peoplesoft HRMS database Functional flexibility, the ability to perform human resources, feat in a single click, is a cornerstone of the peoplesoft product.

→ To prevent a tangled web of data, peoplesoft stores data using a database organizational concept called "data integrity". The philosophy of data integrity is simple a database stores data efficiently by storing it once, and only once.

Table contains the most commonly used data in peoplesoft HRMS. These tables are not all essential, but they are accessed often and provide the foundation for the database.

Types of table

Base Table:

A base table is the place where nearly every query starts. These tables store information about an employee and contain data about the employee. A base table stores like data that is continually changing.

Control table:

A control table contains a short list of values that classify and categorize. For eg: A table that contains all of the possible earnings codes (regular, bonus, overtime etc) is a control table.

Views: These tables are similar to views, but are not dynamic. Their data is only current after a program is executed every night.

Application Tables

The peoplesoft application stores application rules and definitions in application tables.

With few exceptions, these tables store data that is not relevant to the organization.

The Non-table: Sub-records.

People soft is intent on making sure no data on effort is ever duplicated. For this reason, they created sub records.

Sub records are like a mere table, since they are definitions of a group of fields.

Identifying the elements in table

Once we find the table we're looking for then we have several ways to look at it.

Most people find it quicker and more convenient to print out the table.

Keys

Identifying the keys in a table is a critical step to retrieving accurate data.

Key are the unique identifier of a row in the table. sometime there is one key, such as employee ID, but more often there are several

<u>EMPL ID</u>	<u>COMPANY</u>	<u>EFDIT</u>	<u>STATE</u>
8121	CCB	01-JAN-1991	CA
8121	CCB	01-JAN-1991	PA
8200	PST	01-OCT-1993	CT
8200	PST	01-JAN-1991	CA

Required fields

The column labeled "Req" tells you whether people soft requires a field.

A required field from an application perspective must be filled in.

When inputting data using a SQL statement the required flag tells you whether to expect blanks in the data returned.

Prompt tables

The prompt table column lists the tables that provide values for a certain field.

Often this is a control table. In people soft, when trying state tax data into a panel.

3) Detail about people soft financial Management System.

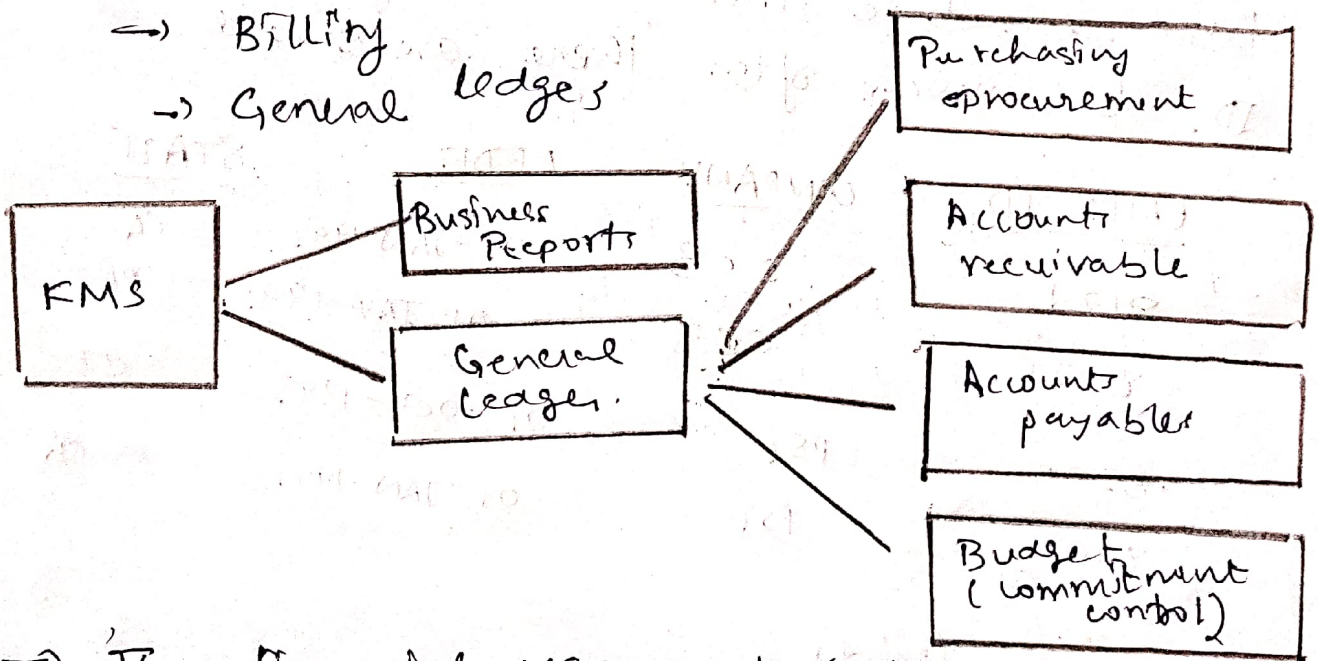

The financial Management System (FMS) encompasses modules including -

→ Account payable

→ Receivable

→ Billing

→ General ledges

→ The Financial management System (FMS) is composed of many modules. The modules are designed to perform specific activity.

Those activities or tasks includes accounts ledger, payable, accounts receivable, billing, payroll processing etc.

General ledger

Financial transactions are generated in separate systems and loaded into the general ledger

eg includes daily cash receipt, service center charges and department allocations and corrections

Accounts payable integration

Each application uses details from peoplesoft transactions.

This information is used to build reports, which in turn is used to ensure accurate accounting of funds distribution (your yearly budget)

Commitment control

Commitment control is used in people soft to manage all budget activity.

View all available balance and transactions for a given cost centre.

Move funds between cost centers.

Purchasing Application:

e procurement

Used to purchase goods and services using a web-based application.

Available from galaxy postal.

e procurement designed to:

Reduce purchase order cycle time.

Make purchasing and check requests as early as possible.

Travel and expenses

- Use paper forms to set up travel and record expenses.
- Transactions are captured in general ledger.

Purchasing card

- Used to make authorized purchases.
- Transactions are captured in general ledger.

Work flow process

The creator submit transaction such as an EOI Journal to work flow approval. Each approver, receives and approve or denies the journal.

Initiator	Level 1	Level 2	Level 3	Level 4	Work Notif center
	Department Approver	Fiscal officer Approves or Disapprove	Executive Approves	Budget office Approved	

The finance or budget approver finalizes the transaction.

Business reports

Using the business intelligence reporting application, you can view detailed or summary reports application, ~~you can~~ of financial activity

Review monthly or annual expenses and revenue by cost center.

Review project activity.

Review salary and wage for a cost center.
