

PART – A (10X2 = 20 MARKS)

ANSWER ALL THE QUESTIONS

1. What are the two channels of communication and explain its branches?
2. What do you mean by accuracy in communication process?
3. What is Scanning?
4. What is intensive reading?
5. What is note making?
6. What are the four modes of writing?
7. What is annotated Bibliography?
8. What are the types of reports?
9. What are the objectives of an interview?
10. Transcribe the following words phonemically.
(a) Index (b) Psychology (c) Critic (d) Dynamic

PART – B (5X11 = 55 MARKS)

ANSWER THE FOLLOWING QUESTIONS

UNIT - I

- 11 a) How to develop an effective listening skills? (11)
- 12 a) What are the barriers of effective Communication? (5)
b) Elaborate the four stages of listening?
(6)

UNIT - II

13 Read the following passages.

The sun is the most direct source of energy. It powers the flow of wind and water cycles and sustains all life. Plants use this energy to synthesize carbohydrates from simple substances like carbon dioxide and water. All the food is derived from the process of photosynthesis. In fact, the energy by which all the animals including human beings live is generated by the oxidation of the food produced by the plants.

The sun contains in its core hydrogen nuclei moving at very great speeds. Whenever these nuclei collide and fuse to form a nucleus of a heavier element, it results in nuclear reactions. These reactions generate tremendous amount of energy. It is energy that powers the sun.

The sun emits lights of different wave lengths. If sun light is passed through a prism, each of these wavelengths is refracted by a different amount. Violet has the shortest wavelength, and red has the longest. The wavelength of the green is midway between that of violet and red. Light with wavelength shorter than that of violet is called the ultraviolet light. Light with wavelength longer than that of red light is called infrared light about one third of light from sun is infrared.

We know that nuclear reactions that go on in the interior of the sun liberate a large amount of energy. Nuclear of deuterium, which is the heavier isotope of hydrogen collide in the sun's interior to produce helium. The energy liberated in these reaction fires the sun, which, in turn, emits lights of different wavelength. Of these wavelengths that heat up the earth. The reaction in which the hydrogen in the sun is converted into helium is called the fusion reaction.

(a) Make the detailed notes of the above passage.

(5)

(b) Summarize the passage to about 1/3 of its length.

(6)

(Or)

14. (a) Answer the questions: (6x1=6)

(6)

(i) What is fusion reaction?

(ii) What is nuclear reaction?

(iii) What is the central idea of the passage?

(iv) What is photosynthesis?

(v) What is refraction?

(vi) What is infrared light?

(b) State whether the following are *True* or *False*: (5x1=5)

(5)

i. Sun powers the flow of wind and water cycles and sustains all life.

ii. Human die of oxidation of the food produced by plants.

iii. The sun emits lights of same wavelength.

iv. Nuclear reaction that goes in the interior of the sun liberates a large amount of energy.

- v. The fusion reaction converts helium to hydrogen.

UNIT - III

15. (a) Write a detailed notes on paragraph writing.

(5)

(b) Explain, How will you prepare a list of references for your project report?

(6)

(Or)

16 (a) Explain with examples, how to prepare a bibliography for a project work?

(5)

(b) Explain the role of Library in pursuit of knowledge

(6)

UNIT - IV

17. Write a set of 11 instructions to the students to be followed in the chemistry laboratory.

(11)

(Or)

18. Write a progress report in the form of letter that you are giving your professor a quarterly update of your six month internship with industry.

(11)

UNIT - V

19. Effective participation in Group Discussion is an example of a Good Personality, Explain.

(11)

(Or)

20. Define the Extempore, Role play, Mono-acting, Field work and team work.

(11)
